## ABSTRACT

[0035] A quick-coupling device having a support (18) on which a female member (20) is mounted in a manner to move between a position of retaining a male member (14E) in a position fitted into the female member (20) to a position of releasing the male member (14E) from the female member (20). This device has a lever (24) articulated to the support (18) between a rest position, separated from the female member (20) to a position of collaboration that allows with the female member (20) to be driven toward a position in which the male member (14E) is released. The lever (24) includes structure (26) for guiding the male member (14E) in such a way as to encourage guidance of the male member (14E) to mate it with the female member (20) when the lever (24) is in the rest position.
